

Possible solution to re-scaling of vertical dimension is to create a new subcomponent bounded by dotted line - however that may cause a line that I dont want and cant hide

SubComponent 2 - called "corbel"

I don't want to see this line - I have hidden the vertical edge of the subcomponent 2 but the edge of Subcomponent 1 still shows

The reason there are 2 components are so I can vary location and size of subcomponent 2

I want this dimension to stay fixed as I rescale panel size...at the moment it rescales according to the overall height

or

is there a way of setting a dimension inside a dynamic component that isnt Lenx, Leny or Lenz

SubComponent 1 - called "panelnocorbel"
